

<b>SANYO</b>	No.3343A	<b>LA7680, 7681</b>
	<b>Single-Chip Signal Processor for Color TV Use</b>	

**Overview**

The LA7680 and LA7681 signal processors provide all the components required to decode PAL or NTSC Color television signals. On-chip circuits include VIF, SIF, a video processor, a chroma demodulator, and deflection drivers.

The self-adjusting signal processors support vertical field scanning rates of both 50 and 60Hz, allowing the LA7837 and LA7838 vertical output drivers to maintain a constant picture height.

The LA7681 replaces the LA7680's G-Y output at pin 22 with a color contrast signal for input to a SECAM chroma demodulator. This contrast signal is fixed at the maximum.

The LA7680/7681 is available in 48-pin shrink DIPs.

**Features**

- Minimized external components

- 48-pin shrink DIP

**VIF/SIF**

- High-gain VIF amplifier

- Fast-response automatic gain control (AGC)

- No delay between audio input and output

- Muting for both audio and video signals or for audio alone

**Video processor**

- On-chip two-dimensional differential circuit

- Variable current transfer

- 7MHz bandwidth

**Chroma demodulator**

- PAL and NTSC system compatible

- Optimized demodulation angles and ratios

- High performance burst cleaning filter and ACC/killer detector

- On-chip tint circuit (NTSC only)

**Deflection drivers**

- Adjustment-free vertical or horizontal synchronization

- Two-stage automatic frequency control

- Adjustable separation sensitivity for vertical synchronization

- Fixed picture height for both PAL and NTSC

- Fixed picture height

**Package Dimensions**

unit:mm
